ACCELERATE YOUR SUCCESS

▶ **Leverage Best Practices in Multi-Cloud Strategies from Sungard Availability Services**

Is your legacy environment holding you back from your IT transformation?

**Do you have a thorough understanding of your cloud strategy?**

As part of the cloud journey, many organizations have moved applications to public clouds such as Amazon Web Services (AWS) or Azure, or have partnered with a SaaS/PaaS provider to enable similar outcomes. But often there is potential to "hit the wall" and struggle with applications that cannot move to a public cloud due to either regulatory or security concerns or, even more challenging, a legacy environment that is simply not cloud-ready. It can literally take years to migrate from legacy to a more modern infrastructure. In the meantime, diverting resources from critical business projects.

Break through the "cloud wall" and accelerate digital transformation and resiliency goals with a Sungard AS multi-cloud approach.
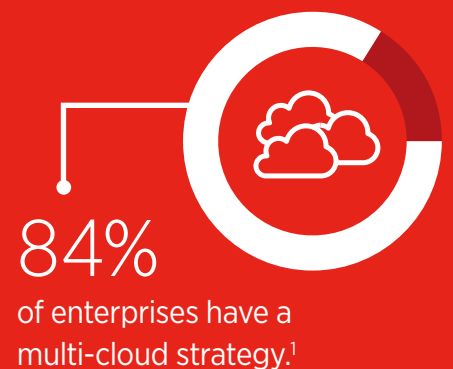

Sungard AS has 40+ years of providing "as a service" solutions associated with the production and recovery of complex environments.

We know the importance of starting with a strategic plan in order to identify the unforeseen "gotcha's" that can arise. Sungard AS has developed best practices that go over and beyond designing just the cloud architecture. *We have the experience to assess the risk of the proposed architecture and make recommendations to optimize your application resiliency/recovery.*

Our cloud consultants will insure you've decreased the risk of failure and wasted investment by designing a high-performance, secure, enterprise-class multi-cloud strategy, with the resiliency and recovery you need to meet your business objectives.

Multi-Cloud Is the Preferred Strategy Among Enterprises.

84%
of enterprises have a multi-cloud strategy.[1]

SUNGARD AVAILABILITY SERVICES®

But what about applications that cannot be moved to a public cloud? Or, legacy environments that will never easily shift to a cloud?

Sungard AS offers private clouds that combine the scalability and agility of a cloud infrastructure with the security, control and superior performance of a fully dedicated environment. Our customers gain the benefit of single tenant resource control, security and performance.

For legacy, (physical servers, mainframes, i-Series, p-Series) and demanding applications (homegrown), Sungard AS offers a managed "lift and shift" environment in our data centers to potentially move infrastructure from capital expenditure investments to operating expense. *Allowing Sungard AS to manage legacy environments, accelerates client timetables to get out of the data center business.* As a result, IT can focus on the company's digital transformation objectives while at the same time make decisions on legacy environments — whether to refactor, rethink, or reimagine the most important applications.

Resiliency is critical to a company's survival– downtime today greatly impacts the customer experience and operations.

Even clouds can go down. Every project we undertake, we think about resiliency. Our comprehensive solutions include integrated security and recovery services to create a fully recoverable production environment. We can protect and recover your multi-cloud environments with guaranteed SLAs. From public cloud (AWS and Azure) to legacy infrastructure.

Sungard AS is one of only a few AWS MSPs (Managed Service Provider) and the "only" partner to guarantee SLA's associated with your AWS or Azure cloud recovery.

Sungard AS knows not all recovery solutions are the same. Our solutions allow you to master your multi-cloud environ-ment, protect and recover everything from your office space to systems and data, and accelerate innovation throughout your enterprise, even during the most challenging times.

Our suite of production and recovery solutions power our customers' mission critical IT
